A separation of omeprazole, related compounds, and impurities is performed on the HALO® Elevate column. Using a high pH compatible stationary phase the separation is completed using a 10 minute linear gradient. With a pKa of 9.3, omeprazole requires high pH in order to get the best separation. By using the Elevate column at a pH of 10.6, a complete separation of 9 different peaks is achieved. This method was improved upon by using DryLab® software, decreasing the runtime from 9 minutes to 6 minutes total. The efficiency of the Fused-Core® particle can be seen in full affect with the decrease in runtime. With the retention of a C18 phase there is room to increase the speed of this separation, improving on the current USP method for omeprazole.
